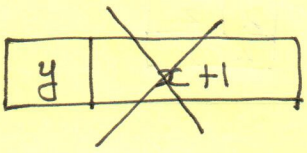
Twas brillig and the slithy toves did gyre and
gimbel in the wabe.

```
let rec rpe (b , e) =
    if b=0 then 0
    else if e=0 then 1
  else if (odd e) then
          b* rpe (b, e-1)
       else rpe(b, e/2) * rpe(b, e/2).
            let v = rpe (b, e/2)
            in  v * v
```

NOT TAIL RECURSIVE

let creates a binding
Bindings come in layers.

We never bind a name to an unevaluated expression.



```
let x = 1729 in
  let y = x+1 in
    x + y
```

y	1730
x	1729

```
let x = 1 in
  let y = x+1 in
    let x = 2 in
      y
```

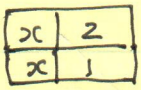
⇝ 2

NOT 3

x	2
y	2
x	1

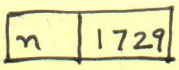
The meaning of a binding does not change: STATIC BINDING

```
let x = 1 in
 let  x = 2  in
      ~<exp>.
```



```
let inc (n) =  n+1
```
→ parameter

```
inc (1729)
```
→ argument



← a binding is created by a function application (or call) when the call is over this binding is removed.

```
inc 3;;
inc 5;;
inc (inc (inc 3));;
```

→ 6
